

Strong tropical wave expected to bring severe weather conditions over St. Lucia

 **Urgency:** Future

 **Severity:** Severe

 **Certainty:** Likely

Issued:

Thu 19 Mar 2026
18:57

Effective:

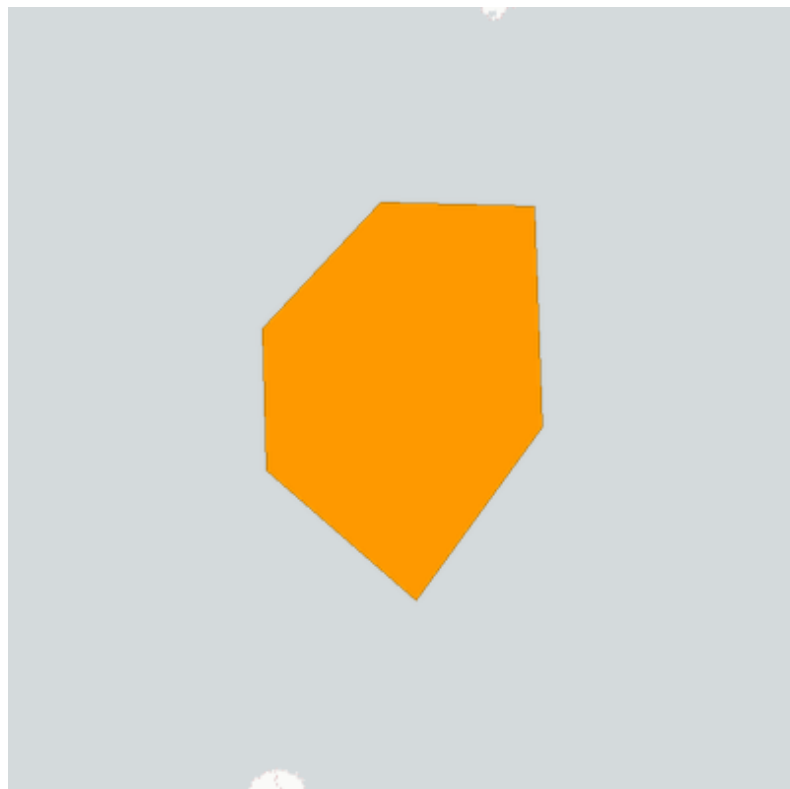

Sat 18 Oct 2025
15:00

Onset:

Sun 19 Oct 2025
15:00

Expires:

Tue 21 Oct 2025
08:00

Area:

St. Lucia and surrounding waters

Description:

A tropical wave located a few hundred miles east of the Lesser Antilles is expected to impact the St. Lucia from late Sunday into Monday. This system has a high potential for heavy rainfall, thunderstorm activity, and gusty winds. Heavy rainfall is expected to lead to localized flooding, particularly in low lying and flood prone areas. Traffic disruptions expected due to poor visibility and water accumulation on roads. Gusty winds may cause loose objects to become airborne as well as damage to weak structures and trees. Rough seas are expected posing a hazard to small craft operators and sea bathers.

Instruction:

Secure loose outdoor objects. Small craft operators should monitor marine advisories and should avoid venturing far offshore during rough seas. Motorists should avoid flooded roads. Do not attempt to cross when water levels are high. Drains should be cleared to avoid blockage. Residents in areas prone to flooding and landslides should exercise EXTREME caution. Stay informed by monitoring official updates from the St. Lucia Meteorological Services and NEMO.
